

CORSAIR CONTRIBUTION

APIpie developer experience

Documentation and authentication test coverage for the APIpie AI plugin

What changed

Package onboarding

Added `packages/apipie/README.md` with installation, setup, environment-variable wiring, operations, caching, and error guidance.

Reference documentation

Added overview, API, webhooks, and database pages under `docs/plugins/apipie/`.

Discoverability

Registered APIpie's documentation pages in `docs/docs.json` navigation.

Authentication tests

Covered inline-key precedence, credential-store fallback, and missing-key failure behavior.

Documented API surface

Operation	Purpose
<code>models.list</code>	List models with optional type, provider, model, and availability filters.
<code>models.listDetailed</code>	List capabilities, modalities, limits, and pricing metadata.
<code>chat.createCompletion</code>	Create an OpenAI-compatible chat completion.
<code>embeddings.create</code>	Create embeddings for one or more strings.
<code>images.generate</code>	Generate images from a prompt and cache URL metadata when a database is configured.

Developer guidance

- Configure local development with `apipie({ key: process.env.APIPIE_API_KEY })`.
- The plugin does not load environment variables implicitly; the application passes the value explicitly.
- Without an inline key, Corsair resolves `api_key` from its encrypted credential store.
- HTTP 429 responses honor `Retry-After`; billable POST requests are not automatically replayed after errors.
- APIpie exposes no webhook operations or incoming webhook handlers.

Files added or updated

Path	Role
<code>packages/apipie/README.md</code>	Package-level quickstart and behavior notes.
<code>docs/plugins/apipie/*.mdx</code>	Public documentation pages.
<code>docs/docs.json</code>	Documentation navigation registration.
<code>packages/apipie/plugin.test.ts</code>	Credential resolution tests.
